

Darts for Windows

Getting started: Setting up and starting a Super League match & Exporting the Results.

Getting started - setting up and starting a Super League match

Darts for Windows can be used for Super League singles. DfW supports teams from 3 to 12 playing best of x number of legs pr. set/match.

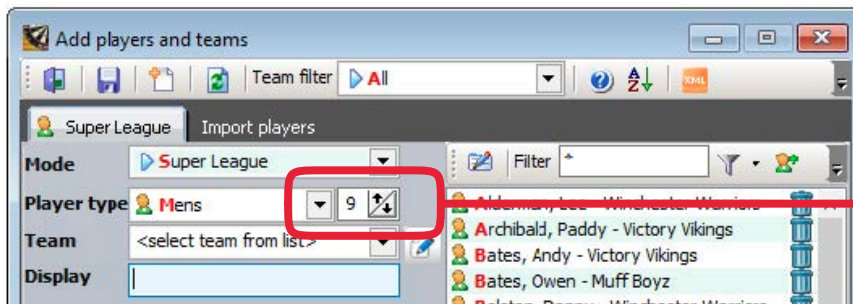

To setup Super League teams, we start by adding the team names and the players to the database.

Click [this link](#) to learn how to add team names and players to the database. Press **CTRL-P** on the keyboard to open the

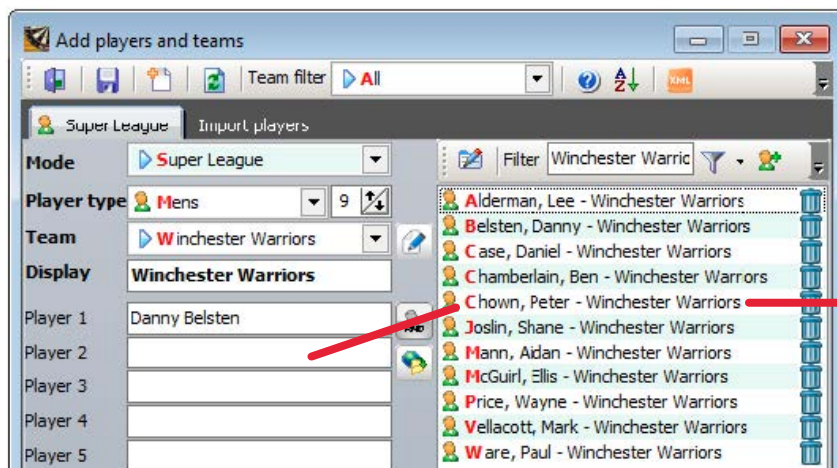

"Add new players and teams" screen.

When we have all the players and team names we need in the database, we can start to setup the Super League teams.

We start by switching the mode to **"Super League"** (see picture)

As you can see, the players are now visible on the right side. In my sample I'm going to setup two 9 player teams, **Victory Vikings & Winchester Warriors**. Change the number of players as in the picture, you can see that the number of players is set to **9**.

We can now start to add players to the team. You don't have to set the team name before you start. As soon as the first player has been added to the team the team name changes to the same team as the first player added.

Drag & drop the player into any box or double click to insert player in the first available position

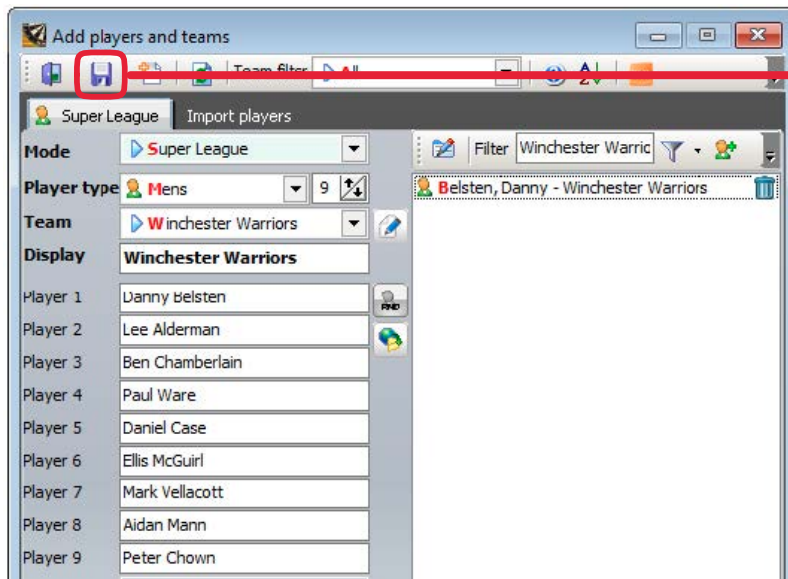

If you want to change the display name of the team (if the team is for example a "B" team), change the text in the **"Display"** box.

Example:

Team: **Winchester Warriors**

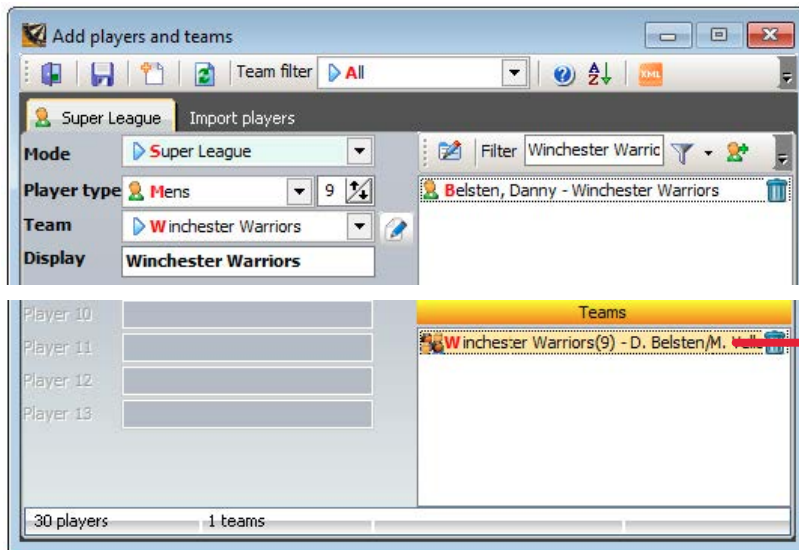

Display: **Winchester Warriors B**

Continue to add the players to the team by dragging and dropping or double clicking on the players name in the list until the team is complete.

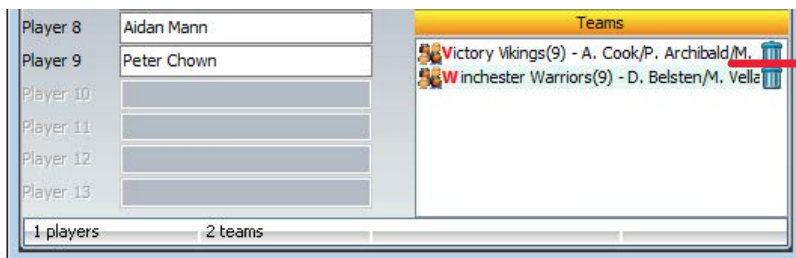

Click to save team setup

When the team is complete, click the "Save" icon in the toolbar.

Team setup saved to database

Repeat the steps for the second team.

Both team setups are now saved to the database

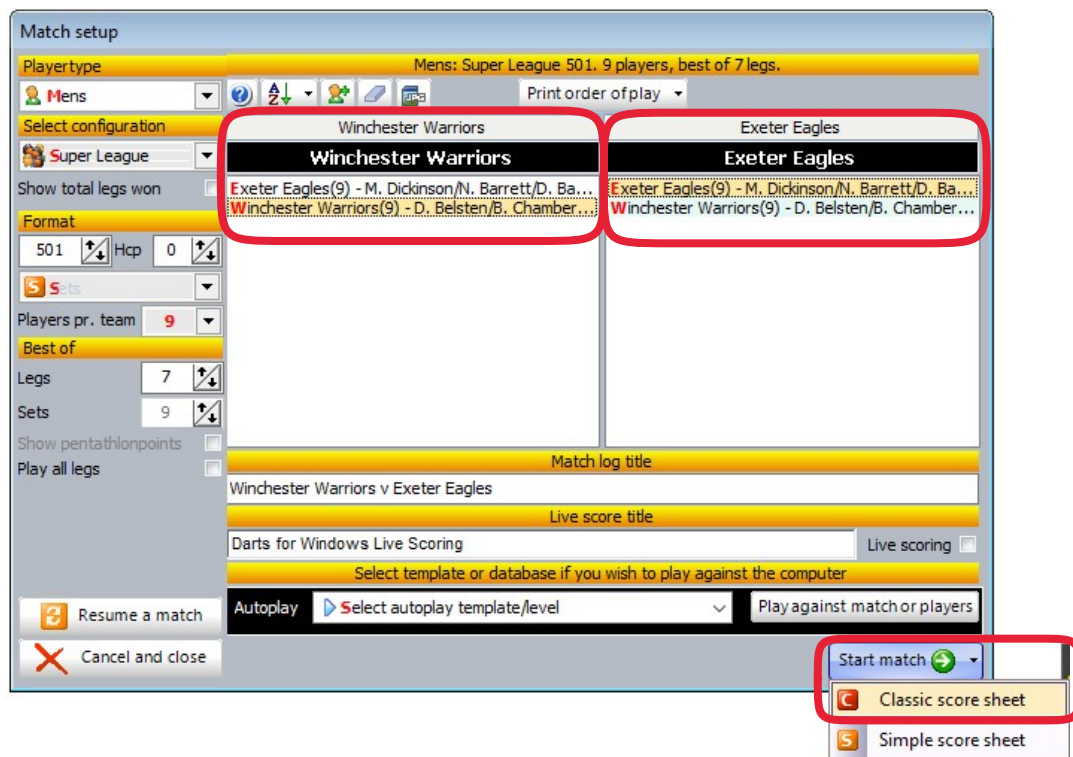

We now have two teams in the database and we're ready to start the match.
Press **CTRL-N** on the keyboard to start a new match or click the item **"New Match"** in the **"File"** menu.

Set the match type to **"Super League"**, set the number of players in the team (9 in this sample) and then set the number of legs in the set, 5 for the ladies or 7 for the men (best of 5 is the default).
If no teams are shown in the list, make sure you have set the correct number of players in the team (9 in this sample).

Select the team on the left side (home) by clicking the team name in the list. Repeat the step on the right side (away). Click **"Start match"** & then click **"Classic score sheet"** to open the match screen.

Click "Yes" to continue...

Click the side who starts the match...

The arrow points to the player who starts the match, this can be changed after bulling up by clicking on the red arrow so it points to the side of the player starting.

PLAYERS		
ESTER WARRIORS * PORTERS PA		
AVERAGE	RESULT	AVERAGE
22.87	6-3	22.96

When all matches have been played, a stats screen will pop up.

To close the stats screen and return to the scoresheets, click the "X" in the lower right corner.

Close the match screen by clicking the "X" as shown here.
